

## **FRIDURIT Full-Size Laboratory Benchtops Made of Technical Ceramics**

Full-size laboratory benchtops and sinks made of Technical Ceramics have for many years been the hallmark of FRIDURIT Laboratory Technology. They are made of a natural material with outstanding properties.

Thanks to its extreme hardness and durability, the silky surface of the products remains smooth and impeccable, even after years of intense exposure to chemical, mechanical and thermal strains and stresses. This makes cleaning easy while at the same time enabling thorough disinfection and decontamination of the work surfaces. Technical Ceramics are produced from natural raw materials such as clay, kaolin and feldspar. They contain no solvents or heavy metals and are also food-safe and odourless. For this reason they are recommended by building biologists. As Technical Ceramics can be 100 % recycled, they also make an active contribution to protecting our environment.

FRIDURIT full-size laboratory benchtops are fully flexible in terms of both shape and colour and can be optimally adjusted to meet the individual needs of the laboratory workplace.

We will be pleased to supply you with information and support.
