PetroOXY – New instrument for determination of Oxidation Stability of Liquid Fuels

Evolved to improve traditional test methods PetroOXY will establish a new method for testing the oxidation stability of fuels and greases. A closed test system also allows for more precise testing of highly volatile samples.

The PetroOXY provides very fast test cycles (typically less than one hour), improved user safety, easy sample handling, small sample size (approx. 5 ml), a fast and simple cleaning procedure as well as fully automatic operation. It offers clear and understandable results with significant improvements in repeatability and reproducibility.

It is an excellent tool for everyone involved in the development, production, storage and use of fuels including FAME and fuel additives.
